CLEAN YOUR TOWERS BEFORE ITS TOO LATE

Cleaning of Cooling Towers is predominately carried out by water treatment Towers companies as part of the site agreement and to cover Workplace Health and safety requirements.

In recent years the water quality in the greater Brisbane area, Gold Coast and Toowoomba have suffered due to low dam levels and increased water hardness. Adding the requirement to increase cycles of concentration we are seeing a lot of cooling towers with large amounts of scale build up causing the fill to become blocked and brittle. This is greatly reducing the thermal efficiency of the tower and costing the clients money in running costs and water blow down levels.

Take the next step from the water treatment companies routine clean and carry out a once a year tower shut down, disassemble, remove fill and thorough clean. As a specialist Cooling Tower Maintenance Company, we often are called in when it is too late - strainers are becoming blocked, nozzles have dislodged and blown holes in the PVC fill, there is a large scale build up on the air inlet louvers or the eliminators are bypassing causing drift.
